

CHECK YOUR OIL.

Perfect chips start with perfect oil

1

HEAT IT

Oil at operating temp: **325–400°F** (163–204°C). Test before the rush, same time every day.

2

DIP IT

Dip the strip until **all four bands** are under the oil, then pull it out. Hold the top of the strip firmly with steel tongs so your fingers stay clear.

3

READ IT

Bands flip **blue** → **yellow** within seconds as free fatty acids (FFA) rise. Match it to the chart below.

DIP FOR 5 SECONDS. REST FOR 30.

Give the bands the full 30 seconds before you read them. That's the accurate result.

WHAT THE STRIP IS TELLING YOU

ALL BLUE

Fresh oil. Fry on.

OVER 2%

Breakdown has started. Keep an eye on it.

OVER 3.5%

Check chip color & taste.

OVER 5.5%

Quality is slipping fast. Plan the change today.

OVER 6% FFA? DUMP IT.

All four bands yellow means the oil is done. Change it. Bad oil never makes it to the tray.
